

ANOTE Marketing Brief

Last updated: 2026-04-24. Based on direct inspection of `ANOTE\_mobile` and `ANOTE-web`, plus previously used doctor outreach materials shared during this session.

Purpose

This document is the shared source brief for future ANOTE marketing campaigns, posts, emails, landing-page copy, ad concepts, videos, and sales messaging.

It focuses on:

- what ANOTE is,
- who it is for,
- what problem it solves,
- what makes it valuable,
- which selling points are strongest,
- and which claims should be used carefully.

One-Sentence Description

ANOTE is an AI-powered medical documentation assistant that helps doctors turn spoken patient visits into structured medical reports in seconds, reducing administrative burden and giving more time back to patient care.

Short Product Description

ANOTE is designed for doctors who spend too much time typing and rewriting clinical documentation after or during patient visits. The product records speech, transcribes the conversation, and generates a structured medical report tailored to the type of examination.

The current ANOTE product presence has two main parts:

- `ANOTE\_mobile` – the core mobile application used for real medical dictation workflows.
- `ANOTE-web` – the public marketing website and browser demo used to explain and showcase the product.

Core Problem ANOTE Solves

ANOTE addresses a clear and painful problem in healthcare: doctors lose a large part of their working time to documentation and repetitive administrative writing.

This creates several downstream problems:

- less time and attention for the patient,
- slower clinical workflow,
- more after-hours documentation,
- greater mental fatigue and burnout risk,
- and more chances for mistakes during manual rewriting.

This problem is already reflected in the team's existing outreach and presentation materials and is strongly aligned with the actual product architecture.

ANOTE Solution

ANOTE helps doctors document visits faster by turning voice input into structured reports.

In practical terms, the workflow is:

1. The doctor records the visit or dictation.
2. ANOTE transcribes the speech.
3. ANOTE generates a structured medical report in the expected format.
4. The doctor reviews, edits if needed, and copies or sends the result onward.

The product is positioned as documentation support, not as a replacement for clinical judgment.

Main Value Proposition

ANOTE helps doctors spend less time typing and more time practicing medicine.

Strongest Selling Points

1. Direct time savings

ANOTE is built to reduce the time spent writing anamnesis and visit summaries manually.

This is the clearest commercial benefit and should stay central in marketing.

2. More focus on the patient

By reducing typing and post-visit admin work, ANOTE supports a more natural doctor-patient interaction and lets the doctor stay more present during the visit.

3. Structured output, not just transcription

ANOTE does not stop at speech-to-text. It turns spoken content into a structured medical report, which is a much stronger value proposition than generic dictation tools.

4. Designed for Czech medical documentation

The product is specifically oriented around Czech-language medical use cases and Czech clinical report structure. This is an important differentiator against generic global transcription products.

5. Flexible privacy model

ANOTE supports both:

- local/on-device transcription, where audio stays on the device,
- and cloud transcription, where higher speed or accuracy can be prioritized.

This gives a strong privacy and workflow positioning angle.

6. Multiple exam/report types

ANOTE is not limited to one generic note type. The inspected applications support multiple visit and examination types, including:

- outpatient or initial examination,
- follow-up visit,
- gastroscopy,
- colonoscopy,
- ultrasound,
- and automatic type detection.

This makes the product feel more specialized and workflow-aware.

7. Mobile-first usage in real clinical settings

The mobile application is a practical advantage for doctors who move between rooms, work in outpatient settings, or document care away from a desk.

8. Easy output handoff

Generated text can be reviewed, copied, and in some flows sent by email, making ANOTE easier to fit into existing documentation routines without requiring a full system replacement.

9. Browser demo lowers adoption friction

The web product includes a live demo, which is valuable for marketing because prospects can quickly understand the workflow before committing to a meeting or pilot.

10. Built with direct doctor feedback

The mobile repository contains repeated test-feedback cycles with a real doctor. This supports messaging around practical development, iteration, and product shaping with clinicians rather than building in isolation.

What ANOTE Is

ANOTE is best described as:

- an AI medical documentation assistant,
- a voice-to-report workflow tool,
- a tool for automatic anamnesis and visit-note creation,
- a productivity product for doctors,
- and a privacy-aware documentation aid for European healthcare contexts.

What ANOTE Is Not

For accurate positioning, ANOTE should not be described as:

- a replacement for the doctor,
- an autonomous diagnostic system,
- a full hospital information system,
- a patient record system,
- or a certified medical device unless that status is formally established later.

Target Audiences

Primary Audience

- doctors in ambulatory or outpatient practice,
- internists,
- diabetologists,
- gastroenterologists,
- doctors who create repeated structured reports,
- and clinicians with high documentation burden.

Secondary Audience

- clinics and smaller practices evaluating workflow improvements,
- heads of departments looking to reduce administrative load,
- healthcare innovators and early adopters,
- and potential partners or investors viewing the English website.

Buyer/User Motivations

Marketing should speak to these motivations:

- save time every day,
- reduce documentation fatigue,
- simplify routine reporting,
- stay focused on the patient,
- keep sensitive workflows privacy-conscious,
- avoid changing everything about the existing workflow,
- and adopt a tool that can be tailored to the practice.

Key Product Capabilities

The following capabilities are confirmed across the inspected codebases and product materials.

Voice recording and audio input

- recording directly on a mobile device,
- browser-based recording in the demo,
- and audio file upload in the web demo.

Transcription modes

- on-device transcription,
- cloud transcription,
- and live or near-live transcript updates during use.

Structured report generation

- AI-generated structured medical reports,
- templates adapted to visit type,
- and automatic visit-type detection in some flows.

Output handling

- report review and editing,
- copy to clipboard,
- download in the web demo,
- email sending in supported flows,
- and local recording/report history in mobile.

Demo and sales enablement

- public marketing site,
- bilingual web presence (Czech and English),
- live browser demo,
- contact capture,
- and product explanation pages for pricing, FAQ, and report types.

Security and Privacy Positioning

Security and privacy are among the strongest marketing themes for ANOTE, but the wording should stay precise.

Strong messaging angles supported by the current product

- local transcription mode is available,
- in local mode, audio can stay on the device,
- text processing is positioned around EU infrastructure,

- the website and product materials emphasize EU data residency,
- and privacy-conscious architecture is a real part of the product story, not just marketing language.

Safe phrasing to use

- "privacy-first design"
- "on-device transcription mode"
- "audio can stay on the device in local mode"
- "EU-focused infrastructure"
- "built with GDPR-conscious architecture"

Claims that should be used carefully

- avoid claiming blanket legal compliance beyond what has been reviewed,
- avoid implying certification or regulatory approval,
- avoid absolute statements that no data ever leaves the device in every mode,
- and avoid promising hospital-system integrations that are not yet productized.

Differentiation Angles

These are the most useful differentiation themes for campaigns and sales materials.

Specialized instead of generic

ANOTE is more than a generic voice transcription app. It is built around medical documentation and structured report creation.

Czech-first medical use case

The product is adapted to Czech medical terminology and Czech report structure, which is commercially important in the local market.

Local plus cloud flexibility

Many tools force one processing model. ANOTE can be positioned around giving doctors or clinics a choice between local privacy-first workflows and cloud-assisted speed/accuracy workflows.

Workflow compatibility

ANOTE can be described as an add-on or companion workflow rather than a forced replacement of the clinic's existing software.

Real usability, not just concept

ANOTE already has:

- a working mobile application,
- a deployed backend,
- a live web demo,
- multi-type report generation,
- and documented doctor feedback loops.

That is stronger than presenting it as an idea-stage concept.

Most Useful Marketing Messages

Core Messaging Pillars

Save time on documentation

Suggested angle: ANOTE reduces the time doctors spend writing and rewriting medical reports.

Give time back to patient care

Suggested angle: less admin, more attention for the patient.

Speak naturally, get structured output

Suggested angle: record the visit, let ANOTE create the report, then review and finish.

Built for real medical workflows

Suggested angle: structured exam-specific outputs are more useful than plain transcription.

Privacy-aware by design

Suggested angle: local mode, EU-focused processing, and secure architecture for sensitive documentation workflows.

Adaptable to the practice

Suggested angle: can be used as a separate app, a mobile tool, or a workflow extension around existing documentation habits.

High-Value Use Cases for Campaigns

These are strong campaign and content directions.

Use case 1: Outpatient visit documentation

Doctor speaks during or after a visit and gets a structured report faster than typing manually.

Use case 2: Follow-up visits

Routine recurring appointments become easier to document consistently.

Use case 3: Procedure reporting

Specialized formats such as gastroscopy, colonoscopy, and ultrasound support messaging around specialty-specific value.

Use case 4: Mobile documentation away from the desk

The mobile product supports bedside or on-the-move workflows and can be marketed as more flexible than desktop-only documentation tools.

Use case 5: Early-access pilot collaboration

The team's earlier outreach emphasized free early collaboration, customization, and co-development with practices. This remains a strong angle for early-stage adoption campaigns.

Best Content Angles for Future Marketing

Social posts

- doctors spend too much time on admin,

- what if a visit could become a structured report in seconds,
- local vs cloud transcription explained simply,
- before/after workflow comparisons,
- mobile documentation in practice,
- and specialty-specific examples.

Short-form video

- "record -> transcribe -> report" product flow,
- side-by-side: conversation vs finished report,
- privacy-first explanation,
- and clinician-centered story: more patient time, less typing.

Email outreach

- focus on time savings,
- emphasize simple adoption without changing the whole system,
- highlight early pilot collaboration,
- and offer a live walkthrough or demo session.

Website copy

- lead with the admin burden problem,
- show the speed and structure of the output,
- support with privacy and workflow-fit messaging,
- and keep the CTA centered on demo, pilot, or meeting booking.

Search / paid ads

Useful themes:

- AI medical dictation,
- automatic anamnesis writing,
- medical reports from voice,
- doctor documentation assistant,
- Czech medical transcription,
- and GDPR-conscious medical AI documentation.

Proof Points Available Today

The following are reasonable proof points for sales and marketing materials because they are grounded in the inspected repositories or supplied historical materials.

- ANOTE has a working mobile application.
- ANOTE has a live web demo.
- ANOTE supports both local and cloud transcription modes.
- ANOTE generates structured report output, not just raw transcripts.
- ANOTE supports multiple visit types.
- ANOTE has been shaped through doctor feedback.
- ANOTE is designed around Czech-language medical workflows.
- ANOTE is usable on both iOS and Android according to the current web product messaging.

Messaging Risks and Guardrails

These guardrails matter for future campaigns.

Do say

- documentation assistant,
- supports doctors,

- helps reduce administrative burden,
- helps create structured medical reports,
- designed for Czech healthcare workflows,
- and privacy-first or GDPR-conscious design.

Do not say without additional confirmation

- certified medical device,
- fully integrated with hospital information systems,
- fully compliant with every regulatory requirement,
- perfectly accurate transcription in every condition,
- or fully autonomous documentation with no doctor review needed.

Recommended Brand Positioning

ANOTE should be positioned as a practical AI assistant for doctors, with the strongest emphasis on time savings, structured output, and privacy-aware workflow design.

The best market position is not "general AI for healthcare" but rather:

"A focused documentation tool that helps doctors turn conversation into structured clinical notes faster."

Recommended Tagline Options

- Medical reports, automatically.
- From conversation to structured medical report.
- Less typing. More patient care.
- Turn medical speech into structured documentation.
- Automatic anamnesis and medical report writing for doctors.

Recommended Elevator Pitch

ANOTE is an AI medical documentation assistant for doctors. It records speech, transcribes the visit, and creates a structured medical report tailored to the examination type. The product is built for Czech clinical workflows, supports privacy-conscious local transcription, and helps reduce the administrative load that takes time away from patient care.

Recommended Sales Narrative

1. Doctors spend too much time on documentation.
2. Generic dictation is not enough because raw transcripts still need to be rewritten.
3. ANOTE goes further by creating structured medical reports.
4. It is designed for Czech healthcare workflows and multiple exam types.
5. It supports privacy-aware usage, including local transcription mode.
6. It can fit around the doctor's existing workflow instead of forcing a full software change.

Open Points to Verify Before Heavier Campaign Scaling

- final production pricing model,
- exact production deployment details for all privacy claims,
- formal wording for GDPR/compliance claims,
- exact scope of email and system-integration workflows,
- and which specialties should be prioritized first in outbound campaigns.

Bottom Line

ANOTE's strongest commercial story is simple: it helps doctors save time on docu

mentation by converting spoken visits into structured medical reports, while offering a more privacy-aware and Czech-specialized alternative to generic transcription tools.
